Abstract not available for EP1034517
 Abstract of corresponding document: **FR2771528**

The duplication of data held in the memory of a smart card (9) into another smart card (2) is performed by creating another secret code (22) for the second card. This code is produced on the basis of identification information taken from the first card and applicable to the second card. The new identification information in the second card is then recorded at the central supervisory location.
